

POLITECNICO DI TORINO

Corso di Laurea in Ingegneria Informatica

Master Degree Thesis

# Development, Test and Application of a framework for cloud serverless services

**Thesis Supervisor**

Dr. Ing. Boyang Du

**Candidate**

Andrea SANTU

matricola: 251579

**Internship Tutor**

Dott. Antonio Giordano

ACADEMIC YEAR 2020-2021

## **Abstract**

todo

# Chapter 1

## Introduction

### 1.1 Serverless

todo: what is it? description of the framework and description of a plain serverless project

#### 1.1.1 Advantages

todo

#### 1.1.2 Disadvantages

todo

### 1.2 The idea behind Restlessness

todo

Idea behind it. General description. Which problems it aims to solve, advantages (user experience, scalability, coding efficiency) with respect to a plain serverless codebase, disadvantages. Why it is Open Source

## **1.3 Related Works**

todo?? Are there other similar framework? What are the differences? Why use restlessness instead?

## **1.4 Tools**

Development tools/main software used with brief description: git/github, circle-ci, serverless framework, aws, jetbrain's products, slack, npm, typescript etc

# Chapter 2

## Restlessness

Detailed description of the project's structure with description of main components/packages (maybe a class diagram could show easily the structure)

micro-services structure of the project created by the framework handling of environment files

### 2.1 Project created by the framework

todo

description of a project created using the framework

### 2.2 Core

todo

### 2.3 Cli

todo

## **2.4 Backend**

todo

## **2.5 Frontend**

todo

## **2.6 Testing**

todo

handling of tests for the framework itself and for the project created by the framework

## Chapter 3

# Restlessness Extensions

the framework has been designed with extensibility in mind  
some auth and dao extensions are already provided

### 3.1 Authentication

auth-jwt and auth-cognito packages

### 3.2 Database Access Object

dao-mongo package (plus plugin to create a database proxy)

#### 3.2.1 Database Proxy

todo

show data about number of connections until crash in normal situation and when  
using the proxy

## Chapter 4

# Development

### 4.1 Github

Useful tools provided by GitHub (projects to handle tasks) Roadmap, development process/flow (issues, pull requests...)

### 4.2 Continuous Integration

circle-ci

## Chapter 5

# Application

Application to real projects with emerged problems

### 5.1 FGA covid school api

brief description of the project

Problems arised by using restlessness (mainly the need for a database proxy and a solution for cold start, i.e. warmup plugin)

### 5.2 Gbsweb Claranominis api

brief description of the project

Problems arised by using restlessness (mainly necessary migration to micro-services structure)

## Chapter 6

# Deployment

### 6.1 Aws

todo

detailed description of what resources are created when deploying

## Chapter 7

# Conclusions

todo??
